DETAILED ACTION

This communication is in response to after final amendment received on 10/10/08.

Claims 1 – 6 are presented for examination.

Applicant's request for reconsideration of the finality of the rejection of the last Office action is persuasive and, therefore, the finality of that action is withdrawn.

Claim Objections

Claim 1 is objected to because of the following informalities: At lines 2 – 3, the phrase “the electrical properties lacks antecedent basis”. Appropriate correction is required.

Claim 1 is objected to because of the following informalities: At lines 11 - 12, it is unclear what is meant by the phrase “such that an offset of the output signal of the sensor elements in the gradiometer system is minimized”. Appropriate correction is required.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1 – 6 are rejected under 35 U.S.C. 102(b) as being anticipated by Haeberli et al. (6,288,533).

As to claims 1 – 6, Haeberli et al. (Haeberli) discloses a rotation position detector comprising magnetic sensor system having two sensor elements (4, 5) in a gradiometer system, each of which is assigned to one of two permanent magnets (8, 9) having a predetermined separation (a) wherein the two sensor elements (4, 5) are positioned symmetrically to a central axis (1) between the two permanent magnets (8, 9); and wherein in terms of dimensions, separation and position relative to the sensor elements, the permanent magnets are located such that an offset of the output signal of the sensor elements in the gradiometer system is minimized (Fig. 4).
